Project 1--

Symbolic addresses refer to labels. For lw or sw in7(betr)7(uc(beti)-4(o)9(n7(be,)7

file, one instruction per line. Any deviation from this format (e.g. extra
spaces or empty lines) will render your machine

program halts. You may assume that the two input numbers are at most 15
bits
and are positive; this ensures that the (positive) result fits in an
LC3.011 Tm[( )] TJET EMC /P 2>> BDC BT1 0 0 1 75.024 663.46 Tm[(wo)-4(r)9(d.)7( )7(

to
itself. Given the LC3.01 ltstr(su)c(lt)ion set, it's easiest to modlty the
algorithm so that you avoid the right shif(lt). Submit a version of the
program
that computes (32766 * 10383).

Sour m(su)7(lt)iplication program m(su)st be reasonably efficient be at
most
50 lines long and execute at most 1000 instr(su)c(lt)ions for any valid numbers
(this
is several times longer and slower than the solution)lt To ac

most

```
    /* after doing a readAndParse, you may want to do the following to
test the
        opcode */
    if (!strcmp(opcode, "add")) {
        /* do whatever you need to do for opcode "add" */
    }

    return(0);
}

/*
 * Read and parse a line of the assembly-language file.  Fields are
returned
 * in label, opcode, arg0, arg1, arg2 (these strings must have memory
already
 * allocated to them).
 *
 * Return values:
 *     0 if reached end of file
 *     1 if all went well
 *
 * exit(1) if line is too long.
 */

10. Code Fragment for Simulator

Here is some C code that may help you write the simulator. Again, you should
take this merely as a hint. You may have to re-code this to make it do exactly
what you want, but this should help you get started. Remember not to change stateStruct or printState.

```
/* instruction-level simulator for LC3101 */

#include <stdio.h>
#include <string.h>

#define NUMMEMORY 65536 /* maximum number of words in memory */
#define NUMREGS 8 /* number of machine registers */
#define MAXLINELENGTH 1000

typedef struct stateStruct {
    int pc;
    int mem[NUMMEMORY];
    int reg[NUMREGS];
    int numMemory;
} stateType;

void printState(stateType *);

int
main(int argc, char *argv[])
{
    char line[MAXLINELENGTH];
    stateType state;
    FILE *filePtr;

    if (argc != 2) {
```

```
      printf("error: usage: %s <machine-code file>\n", argv[0]);
      exit(1);
    }

    filePtr = fopen(argv[1], "r");
    if (filePtr == NULL) {
      printf("error: can't open file %s", argv[1]);
      perror("fopen");
      exit(1);
    }

    /* read in the entire machine-code file into memory */
    for (state.numMemory = 0; fgets(line, MAXLINELENGTH, filePtr) !=
NULL;
      state.numMemory++) {
      if (sscanf(line, "%d", state.mem+state.numMemory) != 1) {
          printf("error in reading address %d\n", state.numMemory);
          exit(1);
      }
      printf("memory[%d]=%d\n", state.numMemory,
state.mem[state.numMemory]);
    }

    return(0);
}

void
printState(stateType *statePtr)
{
    int i;
    printf("\n@@@\nstate:\n");
    printf("\tpc %d\n", statePtr->pc);
    printf("\tmemory:\n");
      for (i=0; i<statePtr->numMemory; i++) {
          printf("\t\tmem[ %d ] %d\n", i, statePtr->mem[i]);
      }
    printf("\tregisters:\n");
      for (i=0; i<NUMREGS; i++) {
          printf("\t\treg[ %d ] %d\n", i, statePtr->reg[i]);
      }
    printf("end state\n");
}
```

11. Programming Tips

Here are a few programming tips for writing C/C++ programs to manipulate bits:

1) To indicate a hexadecimal constant in, precede the number by 0x. For example, 27 decimal is 0x1b in hexadecimal.

2) The value of the expression (a >> b) is the number "a" shifted right by "b"

bits. Neither a nor b are changed. E.g. (25 >> 2) is 6. Note that 25 is 11001 in
binary, and 6 is 110 in binary.

3) The value of the expression (a << b) is the number "a" shifted left by "b"
bits. Neither a nor b are changed. E.g. (25 << 2) is 100. Note that 25 is 11001
in binary, and 100 is 1100100 in binary.

4) To find the value of the expression (a & b), perform a logical AND on each
bit of a and b (i.e. bit 31 of a ANDED with bit 31 of b, bit 30 of a ANDED with
bit 30 of b, etc.). E.g. (25 & 11) is 9, since:

```
    11001 (binary)
  & 01011 (binary)
----------------------
 =  01001 (binary), which is 9 decimal.
```

5) To find the value of the expression (a | b), perform a logical OR on each bit
of a and b (i.e. bit 31 of a ORED with bit 31 of b, bit 30 of a ORED with bit 30
of b, etc.). E.g. (25 | 11) is 27, since:

```
    11001 (binary)
  & 01011 (binary)
----------------------
 =  11011 (binary), which is 27 decimal.
```

6) ~a is the bit-wise complement of a (a is not changed).

Use these operations to create and manipulate machine-code. E.g. to look at bit
3 of the variable a, you might do: (a>>3) & 0x1. To look at bits (bits 15-12) of
a 16-bit word, you could do: (a>>12) & 0xF. To put a 6 into bits 5-3 and a 3
into bits 2-1, you could do: (6<<3) | (3<<1). If you're not sure what an
operation is doing, print some intermediate results to help you debug.

---

12. Example Run of Simulator

```
memory[0]=8454151
memory[1]=9043971
memory[2]=655361
memory[3]=16842754
memory[4]=16842749
memory[5]=29360128
memory[6]=25165824
```

```
memory[7]=5
memory[8]=-1
memory[9]=2
